

# COSO III REPORT: APPLICATION IN ECUADORIAN CORPORATIONS

Irene Buele, Universidad Politécnica Salesiana  
Andrea Sandoval, Universidad Politécnica Salesiana  
Verónica Espinoza, Universidad Politécnica Salesiana

## ABSTRACT

*Internal Control is fundamental for the management of companies. The COSO III Report is a meaningful document for companies that aim to meet their objectives and reduce the risks in each of their departments. The objective of this study is to know the level of application of the COSO III Report in the corporations of the canton of Cuenca, Ecuador. The investigation was developed with the information obtained by means of a survey applied to the directors of the Corporations engaged in wholesale and retail trade in the canton of Cuenca, Ecuador. Based on this information, a descriptive analysis of the selected sample was made, detailing aspects such as the gender of the owner, educational instruction, and size of the company, presentation of audited financial statements and the existence of an internal audit department. Subsequently, the highest authority of each company rated the level of application of the five components of the COSO III Report by means of a Likert scale. Finally, the hypotheses were formulated and demonstrated through the application of the Chi-square test and the Pearson Correlation Coefficient.*

*Among the results of the descriptive analysis, it was observed that 29% of the small companies are managed by executives with a third level of education. At the same time, it was determined that 51% of the managers who have third level education are male, while the female gender is present in only 17% of the managers. Among the results obtained by applying the Likert scale in the survey, it can be seen that the Information and Communication component reached an average of 2.5/5 being the lowest; considering it a critical component due to the grade obtained, 1 (never) after evaluating the existence of spaces for suggestions. In turn, the Supervision and Monitoring component was also considered a critical component since it obtained an average of 2.96/5 within the application average. Specifically, it obtained a score of 1 (never) when evaluating the existence of written justifications for the acceptance or rejection of recommendations made by employees, customers, or suppliers. On the other hand, the information obtained from the hypotheses determined that the compliance of the Control and Supervision Environment and Monitoring components depend on the existence of an audit department.*

**Keywords:** Internal Audit, Internal Control, COSO III, Medium-Sized Companies, Small Companies.

## INTRODUCTION

Mantilla (2012) states that "internal control is a process carried out by the board of directors, managers and other personnel from an entity. It is designed to provide reasonable assurance that objectives are being met in specified categories". For companies, maintaining an adequate Internal Control system is equivalent to a well-functioning organization, since the performance of its departments will depend on it. The different departments of the organization are responsible for its success or failure, that's because in the absence of a guide and / or a model

to follow which allows the control of all of them, chaos that puts at risk the business growth will emerge.

Internal Control is important for companies worldwide since its objective is to take care of the company against any existing irregularities. For Aguirre & Armenta (2012) Internal Control varies depending on the needs within the company so it is different for each department. Likewise, Internal Control is understood as a plan that the organization owns; that is to say, the methodology it applies aiming to protect its assets, guarantee the veracity of the accounting information, promote efficiency in its operations and encourage compliance with established policies. (Mantilla, 2013).

A guide to implement an internal control system in a company is the COSO Report, defined as:

*A framework model that describes professional practices for establishing preferred business systems and processes that promote efficient and effective internal processes; besides, it is an important model for guidance materials that companies should follow when developing their systems and procedures (Moeller, 2013).*

For Moeller, (2013) the application of internal control based on the COSO III Report contributes to the improvement of business performance, since it manages risks allowing the creation and preservation of business value. Internal controls are an important part of a company's governance system, considering that they are aimed at taking into consideration opportunities and facing possible threats. In risk management, the effort made by the managers, administrative and other personnel is essential to achieve the goals set.

The Committee of Sponsoring Organization of the Treadway (2013) in its last update in 2013, indicated that the Integrated Internal Control Framework COSO III will allow organizations to effectively and efficiently manage their internal control systems; which will be adaptable to the various business and operational environments and which in turn will reduce risks to tolerable conditions. This will benefit decision-making and the establishment of structured governance. Therefore, the Integrated Internal Control Framework COSO III, focuses mainly on the constant progress of the organization. It aims to become an effective Internal Control System, which guarantees its results in the application of the five components that work together with seventeen principles and 3 types of established objectives (Caguano, 2015).

The first component of the COSO II is the Control Environment, which refers to the group of procedures, models and structures that guide the Internal Control at different levels of the company. The Risk Assessment component oversees detecting and evaluating the existing risks that hinder the achieving of objectives. The Control Activities component deals with the policies and procedures that ensure the reduction of risks within the organization. The Information and Communication component is responsible for the disclosure of information by senior management. Finally, the Supervision and Monitoring component refers to the periodic evaluations carried out to determine if all the components of internal control are working as planned (Comité de Organizaciones Patrocinadoras de la Comisión Treadway, 2013).

Correa & Galloso (2018) claim that the five components applied together will allow the goal to be reached. In the same way they allow the establishing of policies that will conduct the organization and that will vary according to the business activity. The proper application of the five components of the COSO III Report allows creation a system capable of responding effectively to changes in the environment, meeting the needs of management and controlling operational activities. In other words, this system allows to maintain a total control based on previous experiences that have provided timely information to avoid errors that have already been made and thus ensure quality in the processes (Ladino, 2009).

On the other hand, the economic environment in Ecuador, as in many countries, is changing due to the creation of new businesses, technological dependence, and globalization, among others. This has allowed changes to be made in internal control, which will allow each of the existing types of companies to grow. Estupiñán (2015) states that economic needs are born mainly from human habit; they are permanently modified generating business possibilities, and risks too obviously, which must be coordinated between administrative and control entities.

Business enterprises are an important part of the Latin American economy. Studies carried out by the Universidad de los Andes show that the greatest concentration of businesses is in the commercial sector with a percentage of 49% compared to other sectors, thus conforming that these companies are generators of employment, with an average of 64.26%. (Saavedra & Hernández, 2017). Correa et al. (2018) added that their importance in the productive area and in employment makes them the axis of economic growth since their dynamism promotes the continuous sustainable development of a country which guarantees the viability and effectiveness within the exercise of their functions.

In Ecuador there are currently about 88,365 legally constituted companies, of which, 19,616 belong to the wholesale and retail economic sector. In the province of Azuay, 971 companies have been incorporated, of which 938 belong to the Canton of Cuenca. Out of these, 185 are corporations, which are the subject of this study. (Superintendencia de Compañías et al. 2019).

By means of a survey, this research determines the level of application of the internal control components in the Corporations of Cuenca, Ecuador in the year 2019. It will allow to know their critical areas to ease their strengthening. Finally, the information collected will contribute to the development of future research regarding this topic.

## METHODOLOGY

For this investigation, the Directory of Companies of the Superintendence of Companies, Securities and Insurance was taken as the source of information; from which a total of 88,365 companies legally constituted in Ecuador were obtained. Subsequently, such information was filtered by economic activity, type of company, province and canton, obtaining a total of 185 Corporations dedicated to wholesale and retail trade in the Canton of Cuenca, province of Azuay. Information corresponding to the year 2017 was used for this purpose. The companies that had foreign investment and presented atypical information were excluded, obtaining a population of 71 companies.

For the collection of the information a survey was formulated that consisted of two sections. The first section was designed to collect informational data and the second section was related to the analysis of the implementation of the COSO III Report. The first section included data such as: gender of the owner, educational background, size of the business, presentation of audited financial statements and the existence of an internal audit department. With regard to the size of the company, the classification according to the National Institute of Statistics and Census (INEC) was taken as a reference (2020) which sorts them according to the volume of annual sales and the number of people employed. It was therefore classified as follows: Microenterprise as the one that includes from 1 to 9 employees. Then, the Small Enterprise that includes from 10 to 49 employees. After that, comes the Medium-sized "A" companies that include 50 to 99 employees. And finally, those of type Medium "B" which include a staff of between 100 and 199 employees.

While in the second section of the surveys a Likert scale was used. It measures individual attitudes or predispositions in attention to specific constructs, through coded items that act as

reagents that allow determining the intensity and direction, positive or negative, of the attitude of each subject (Neris Guzmán, 2017). In the survey, 5 response options were used; they were (5) Always, (4) Most of the time yes, (3) Sometimes yes, sometimes no, (2) Most of the times no, (1) Never, which were answered by the directors of the companies studied.

The reliability of the survey was confirmed with the Cronbach's Alpha Coefficient, which according to Dos Santos (2017) "allows to estimate the homogeneity of the measurement items". This coefficient was applied in the pilot test with a sample of 10 surveys resulting in 0.961, which proves the reliability of the questions asked. Later, the validation was carried out for the rest of the sample, and a result of 0.963 was obtained, which is a positive outcome. Ruiz (2002) mentions that the value obtained after its application should be between 0.8 and 1, where values close to 1 state that the items are reliable; however, if the result is lower than 0.8 the items evaluated may lead to erroneous conclusions.

The results were analyzed in SPSS software and the following hypotheses were evidenced:

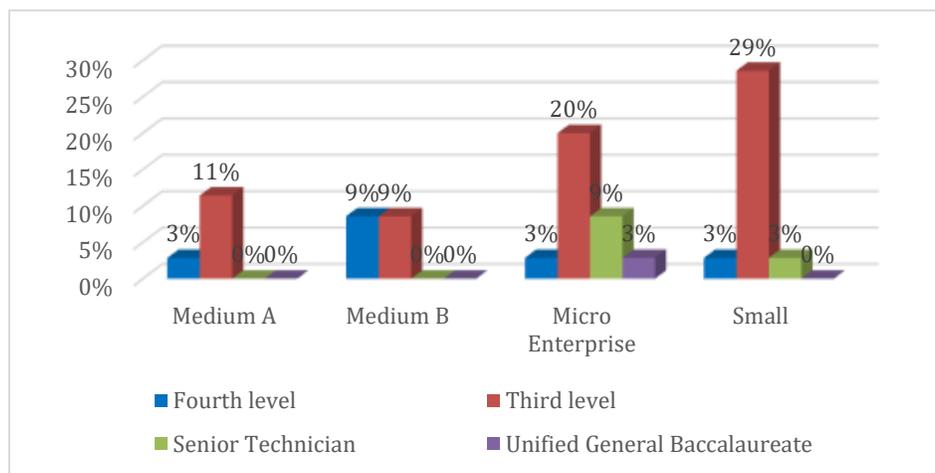

1. *Hypothesis 1: The percentage of accomplishment of the COSO III Report depends on the existences of an audit department in the companies.*
2. *Hypothesis 2: There is a direct relationship between the components of the COSO III Report.*

For the hypothesis 1, the Chi-square test was carried out, which according to Ubillos Landa et al. (2016), is defined as "the instrument that allows to determine the existence of a relationship between two qualitative or categorical variables". For hypothesis 2, a test was performed based on the correlation among the five components. According to Lind et al. (2012) the Pearson's correlation coefficient "describes the strength of the relationship between two sets of variables on an interval or ratio scale".

## RESULTS

The results are shown in 3 sections: 1) General description of the companies studied, 2) Level of application of Internal Control, 3) Hypothesis testing.

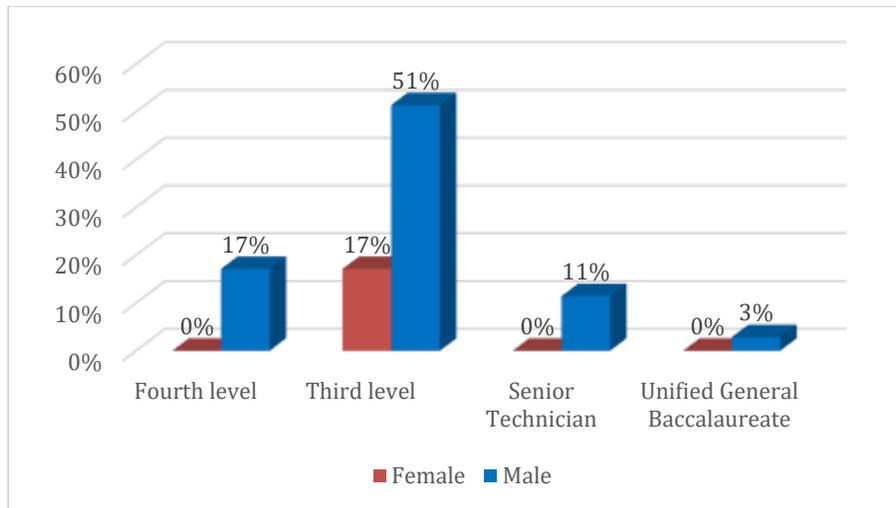

### General Description of The Studied Companies

**FIGURE 1**  
**LEVEL OF EDUCATIONAL INSTRUCTION AND THE RELATIONSHIP WITH THE SIZE OF THE COMPANIES**

Figure 1 shows the interrelationship between the size of companies and the educational background of their managers. It shows that the presence of the Third Level among managers is notorious within small companies with a percentage of 29%. These companies, together with the micro-enterprises, are the most studied in our analysis of the wholesale and retail trade sector.

Within the results obtained in Figure 2, it can be seen that of the total number of respondents there is a high percentage of male managers. Third level educational instruction stands out in the analysis, 51% of male executives have this instruction, while the female gender barely reaches 17%.

**FIGURE 2**  
**LEVEL OF EDUCATION AMONG OWNERS OF WHOLESALE AND RETAIL COMPANIES**

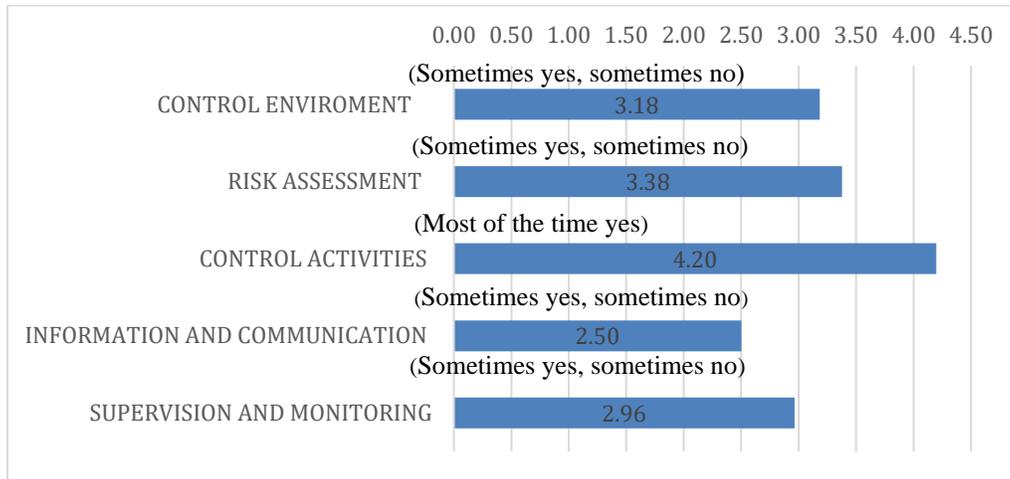

**Level of application of Internal Control**

Figure 3 shows the average use of Internal Control components. Considering as relevant data that the Control Activities component obtained an average of 4.2 (most of the time, yes), which is a high value in relation to the other components.

#	Questions	Average Likert Value
1	Is there an audit committee or other committee that indicates that there is an element of control in the company?	3 (sometimes yes sometimes no)
2	Are employees motivated to achieve better performance in their activities?	3 (sometimes yes sometimes no)
3	Does the company have a formally established code of ethics and conduct?	2 (Most of the time yes)
4	Is the profile evaluated with the knowledge and skills required for each position prior to recruitment?	3 (sometimes yes sometimes no)
5	Is the company's code of conduct provided and made known, verbally and/or in writing, at the time of hiring?	4 (Most of the time yes)
6	When staff are recruited, are the job descriptions and the duties involved made known?	5 (Always)
7	Does the management apply sanctions in case of non-compliance with the company's rules of conduct?	4 (Most of the time yes)
8	Has the company defined procedure and function manuals?	3 (sometimes yes sometimes no)

9	Does the company have an organizational chart that represents its organizational structure?	2 (Most of the time no)
<b>TOTAL</b>		<b>3 (sometimes yes, sometimes no)</b>

Source: Own elaboration based on the surveys carried out from the revision of Mantilla (2012).

**FIGURE 3**  
**AVERAGE OF COSO III REPORT COMPONENTS**

In Table 1, there is a reference to the Control Environment component, where it is evident that when staff is hired, job descriptions and the functions involved are made known. However, in most cases these companies do not have a formally established code of ethics and conduct.

In Table 2, the information collected from the Risk Assessment component is presented, where it is clear that the surveyed companies manage documents carefully, since they are always filed in a suitable and safe place. On the other hand, it is evident that one of the weaknesses of these companies is, that most of the time, they do not have formally established tools to identify risks in the company.

<b>Table 2</b>		
<b>RISK ASSESSMENT COMPONENT</b>		
#	Questions	Average Likert Value
1	Does the company have specific goals for each area or department?	3 (Sometimes yes sometimes no)
2	Does the company have a strategic plan to meet the objectives?	3 (Sometimes yes sometimes no)
3	Is there an Annual Operational Plan for the development of activities within each area or department?	3 (Sometimes yes, sometimes no)
4	Does the company have action plans or improvement plans in case of errors, within the execution of the strategic plan?	2 (Most of the time no)
5	Are there tools that identify risks in the company?	2 (Most of the time no o)
6	Is there a person in charge of filing the documents supporting the transactions, to ensure the confidentiality of the information?	5 (Always)
7	Is the documentation filed in a suitable and safe place?	5 (Always)
8	Is the customer database updated regularly?	4 (Most of the time yes)
9	Are staff asked for documents to support t the work done?	4 (Most of the time yes)
10	Is there a preventive maintenance plan for fixed assets?	2 (Most of the time no)
11	Is access to the offices limited to authorized personnel only?	4 (Most of the time yes)
<b>TOTAL</b>		<b>3 (Sometimes yes, sometimes no)</b>

Source: Own elaboration based on the surveys carried out from the revision of Mantilla (2012).

With regard to the Control Activities component presented in table 3, it is shown that companies have order points to initiate the purchasing process in a timely manner, but at the same time, it is evident that they do not have procedures in place to periodically reconcile existing physical assets with those in the accounting records.

<b>Table 3</b>		
<b>CONTROL ACTIVITIES COMPONENT</b>		
<b>#</b>	<b>Questions</b>	<b>Average Likert Value</b>
1	Are there procedures in place to periodically reconcile physical assets with related accounting records?	3 (Sometimes yes, sometimes no)
2	Does the accounting department make the necessary changes after the physical inventory has been established?	4 (Most of the time yes)
3	Are registration documents issued stating that the physical inventory has been taken?	4 (Most of the time yes)
4	Is there a set amount of minimum stock?	4 (Most of the time yes)
5	Are there ordering points to start the purchasing process in a timely manner?	5 (Always)
6	Does the company have collection policies?	5 (Always)
7	Does the company handle its collection procedures with a segmentation of roles and responsibilities?	4 (Most of the time yes)
8	Is the authenticity of the documents submitted verified when contracting?	4 (Most of the time yes)
9	Are transactions registered at the time of their incidence and processed immediately?	5 (Always)
10	Are the collections deposited daily and is there proof of this in records?	4 (Most of the time yes)
	<b>TOTAL</b>	<b>4 (Most of the time yes)</b>

**Source:** Own elaboration based on the surveys carried out from the revision of Mantilla (2012).

Table 4, related to the Information and Communication component, indicates that most of the time companies provide partners with sufficient, timely and reliable information from management. But on the other hand, they do not have space for staff suggestions.

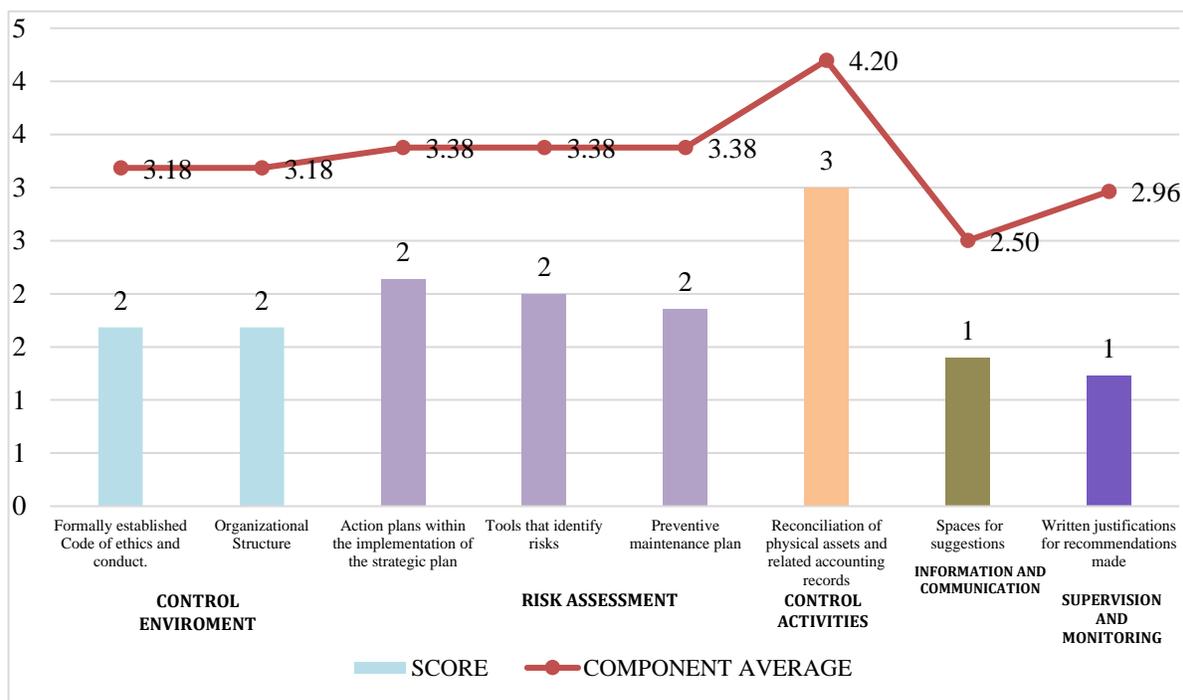

<b>Table 4</b>		
<b>INFORMATION AND COMMUNICATION COMPONENT</b>		
<b>#</b>	<b>Questions</b>	<b>Average Likert Value</b>
1	Does the staff have areas in the company to place suggestions?	1 (Never)
2	Does the company hold regular meetings with staff to publicize results reports?	2 (Most of the times yes)
3	Do partners have enough, timely and reliable information from management?	4 (Most of the times yes)
4	Is there a current technology information recovery (back-up) plan for business functions, systems, processes, and information?	2 (Most of the times no)
5	Are there training processes on new computer systems and on modifications to existing ones?	2 (Most of the times no)
6	Is the information provided by the accounting systems used for decision making?	3 (Sometimes yes, sometimes no)
7	Are the information systems continuously updated?	3 (Sometimes yes, sometimes no)
8	Does the information on the results achieved compared with the objectives and targets set?	3 (Sometimes yes, sometimes no)
9	Have information and communication policies been developed?	2 (Most of the times no)
10	Are information and communication policies disseminated at all levels?	2 (Most of the times no)
11	Does management consider the suggestions received from staff?	2 (Most of the times no)
	<b>TOTAL</b>	<b>3 (Sometimes yes, sometimes no)</b>

**Source:** Own elaboration based on the surveys carried out from the revision of Mantilla (2012).

Table 5 details the information about the Supervision and Monitoring component, where it is shown, that companies; most often supervise staff in their regular activities. But, at the same time, it is evident that there are never written justifications for the acceptance or rejection of recommendations made by employees, customers, or suppliers.

#	Questions	Average Likert Value
1	Are there written justifications for the acceptance or rejection of the recommendations made by employees, customers, or suppliers?	1 (Never)
2	Is the staff supervised in their regular activities?	4 (Most of the time, yes)
3	Does management periodically review the control processes to follow up on their proper application?	3 (Sometimes, yes; sometimes, no)
4	Are the causes of deficiencies in the departments investigated?	3 (Sometimes, yes; sometimes, no)
5	Are the detected deficiencies brought to the attention of the entity's highest executive authority?	4 (Most of the time, yes)
6	Are there evaluation programs that are developed according to priorities?	2 (Most of the time, no)
7	Are the action and improvement plans, resulting from the made evaluations, followed up?	2 (Most of the time, no)
	<b>TOTAL</b>	<b>3 (Sometimes, yes; sometimes, no)</b>

Source: Own elaboration based on the surveys carried out from the revision of Mantilla (2012).

**FIGURE 4  
CRITICAL COMPONENTS COSO III**

Finally, Figure 4 shows a comparison between the values obtained in the questions that had lower scores per component against the average for that component. These data directly influence the Internal Control of each evaluated company. The biggest gap between the average of the

component and the value obtained in the Supervision and Monitoring component can be seen with regard to the written justifications for the recommendations.

## Hypothesis Testing

*Hypothesis 1: The percentage of compliance with the COSO III report depends on whether there is an Audit department in the company.*

In Table 6, the acceptance or rejection of the hypothesis raised for each component is displayed.

<b>COSO III Components</b>	<b>p Value</b>	<b>Sign</b>	<b>Level of Significance</b>	<b>Hypothesis</b>
Control Environment	0,039	<	0,05	Rejects
Risk Evaluation	0,096	>	0,05	Accepts
Control Activities	0,795	>	0,05	Accepts
Information and Communication	0,076	>	0,05	Accepts
Supervision and Monitoring	0,048	<	0,05	Rejects

*H<sub>0</sub>: The compliance of the component does not depend on having an audit department.*

*H<sub>a</sub>: The compliance of the component depends on having an audit department.*

Regarding the posed hypothesis, it is concluded that H<sub>0</sub> is rejected: Compliance with the Control Environment component does not depend on having an audit department; since the p value 0.039 obtained from the SPSS program is less than 0.05 of significance level, which indicates that dependence exists, and therefore, H<sub>a</sub> is accepted.

		Average Control Environment	Average Risk Evaluation	Average Control Activities	Average Information and Communication	Average Supervision and Monitoring
Average Control Environment	Pearson Correlation	1	0,750	0,525	0,840	0,789
Average Risk Evaluation	Pearson Correlation	0,750	1	0,648	0,735	0,764
Average Control Activities	Pearson Correlation	0,525	0,648	1	0,728	0,623
Average Information and Communication	Pearson Correlation	0,840	0,735	0,728	1	0,771
Average Supervision and Monitoring	Pearson Correlation	0,789	0,764	0,623	0,771	1

Similarly, in relation to the Supervision and Monitoring component, H<sub>0</sub> is rejected: Compliance with the Supervision and Monitoring component does not depend on having an audit department; since the p value 0.048 obtained is less than 0.05 of significance level showing that dependence exists, which is why the Alternative Hypothesis is accepted.

*Hypothesis 2 There is a direct relationship between each of the components of the COSO III Report.*

*H<sub>0</sub>: The correlation between the components of the COSO III Report is  $\leq 0$ .*

*H<sub>a</sub>: The correlation between the components of the COSO III Report is  $> 0$ .*

## CONCLUSIONS

In conclusion, in the descriptive analysis, it could be clearly seen that in the companies analyzed, 51% of the managers with a third level educational background are male, while only 17% of the same category belong to the female gender.

In turn, and in accordance with the objective of this research, we can conclude that most companies, in relation to the level of application of the COSO III Report, present an average compliance of 4.20 for the Control Activities component, due to the fact that these companies maintain general controls, such as the issuance of registration documents, collection policies, efficient registration processes, among others, which are necessary to safeguard the productive activity. Demonstrating the highest level of application in relation to the rest of the components. However, they present a deficiency in the procedures for periodically reconciling physical assets with the related accounting records.

As for the Risk Assessment component, it was determined that its average application is 3.38. Among its shortcomings, it was determined that most of the time, the company does not have action or improvement plans within the execution of the strategic plan and does not have tools that identify the risks within them. At the same time, the importance of caring for information for these companies is evident, as well as in the assignment of personnel who will have access to it; demonstrating once again that these companies give greater priority to day-to-day tasks and do not carry out long-term strategies, such as prevention measures in the event of risk.

On the other hand, about the Control Environment component, an average compliance rate of 3.18 was determined. It is stated that this is applied when it comes to operational activities. It is understood that one of the particularities of the companies surveyed is the implementation of rules in a verbal manner, such as when the functions of the position or the different sanctions are made known, among others. They present, as a considerable weakness, the application of long-term activities due to the implementation of an organizational chart, or the creation of a formally established code of ethics and conduct. This result is quite detrimental to the companies analyzed, since this component represents the structure of the business, as Mantilla (2012) states, it is responsible for structuring the business activities; it is here that the objectives are formed, the value of the risks are determined, the policies are implemented; in other words, its application is the most important of the components since it is the root of the efficient application of the COSO III Report.

Likewise, the Supervision and Monitoring component is considered critical, since its average obtained 2.96, indicates the lack of supervision in the activities carried out within the company. Mantilla (2012) mentions that monitoring ensures that Internal Control continues to operate effectively. Management states that written justifications were never provided for acceptance or rejection of recommendations made by employees, customers or suppliers. It is also reported that most of the time, they do not follow up on the action and improvement plans that were the result of the evaluations carried out.

Finally, the Information and Communication component for the analyzed companies turned out to be the most critical one, as its average of 2.50 was the lowest. This indicates the deficiency in the lines of communication. That is, among their departments there is no idea of how

the activities they do affect or are related to the other departmental areas. According to the results of the surveys, these companies do not have spaces to make suggestions; in other words, suggestions made by their staff are not taken into account. It also indicates that, in most cases, they do not hold regular meetings in which they inform the staff about the progress of the company. On the other hand, it is necessary to emphasize the evident stagnation, in terms of their computer systems, which are not updated, nor do they provide training to those responsible for their management.

Through hypothesis testing, it was possible to conclude that the implementation of the Control Environment and Monitoring and Supervision components are directly dependent on the existence of an Audit Department. These components are directly linked to compliance with regulations that must be constantly monitored.

And finally, it was demonstrated that the relationship between the five components is direct and significant, as stated by the Committee of Sponsoring Organizations of the Treadway Commission (2013). The joint implementation of the five components will permit to meet the objectives set by the company, as well as to generate a rapid response to changes in the environment and risk management.
