

# EDUCATIONAL LEADERSHIP ACTIVITIES

**Pabitra Kumar Patra, Trident College**

## INTRODUCTION

Since these distant access programs were not at first evolved to build the information move rate between individuals yet rather to permit framework managers to keep up the PCs of their customers distantly by disposing of the need to visit their PC in person when performing upkeep capacities on them, adding some extra highlights that are helpful when utilizing such sorts of projects for instructive purposes would be gainful. Perhaps some helpful new highlights, which could be added to new paid renditions of TeamViewer or AnyDesk, which accentuate on improving instructive results and quickening the rate and simplicity with which new data and information can be moved between huge gatherings of individuals, could make it simpler to more readily recognize diverse individual clients or to permit to incidentally allot selective mouse control advantages to the teacher, in the event that he needs to ensure that his understudies can't intrude on him/her during specific pieces of his introduction. Perhaps a bit of seating graph may be useful for the educator to see which understudy is attempting to assume responsibility for his PC. Or then again to add an element, which like drawing the consideration of the airline steward to the seats of travelers mentioning administration, tells the educator, which understudies have mentioned him/her to take a gander at their screens, may be a smart thought. One could likewise add a component that makes it simpler to characterize work bunches to get to their answers, commitments and questions quicker. The benefit of TeamViewer is that it not just permits direct continuous communications among teachers and understudies, however between everybody simultaneously. This gives a lot more choices to finding support. Possibly a component impermanent keeping understudies from conveying among one another may be useful when the teacher needs to have their full focus.

TeamViewer would likewise be ideal for administering tests since it gives the teacher admittance to the PCs of his/her understudies. A component could be added that takes into consideration recording the test meeting to preclude cheating or admittance to not allowed data of any sort. Understudies could convey inquiries concerning the test with the educator without intruding on their companions. Simultaneously this choice for secret correspondence between any two gatherings may bring down the limit for posing embarrassingly inept inquiries to one's friends or the educator since it is better for any inquiry - regardless of how basic or inconsequential, clear or dumb - to be asked as opposed to staying unanswered particularly since there is frequently a decent possibility for others coming up short on the boldness to ask comparable "*moronic*" inquiries because of dread of likely shame.

One could add extra highlights to monitor the commitments of each colleague to a gathering project. One could likewise follow the grouping, wherein data was added and erased from a group venture to summarize the fundamental manners of thinking later. One could likewise screen the time and endeavors understudies spent on distant tasks by expecting them to just utilize one specific interface and getting to it distantly through TeamViewer.

One could add an element, which makes it simpler, for inability workplaces to delegate tests since numerous handicaps expect PCs to run the projects required by handicapped test takers to more readily make up for the deficiencies and limits brought about by their incapacities while taking tests. Such a choice to delegate tests would be comparatively valuable for any sort of cosmetics tests in any event, when a solitary delegate needs to administer numerous understudies taking their cosmetics tests toward the finish of the semester in various subjects simultaneously on the grounds that each activity at the testing interface can be recorded and

is accordingly reproducible. This component is presently not accessible in any event, when the educator delegate the tests of his ordinary understudies since he/she can't observe all understudies simultaneously.

In the event that the most famous highlights at present offered by Blackboard.com can be joined with those got from TeamViewer as plot above or in the event that they can be offered upon demand in various groups, it is conceivable to charge costs of sizes like what Blackboard is normally charging for its administrations to American colleges. What's more, despite the fact that I was unable to discover explicit costs at Blackboard.com I trust American colleges are paying an excessive lot for such sort of administrations since they could be improved and stretched out with just minimal more endeavors. I see Blackboard determined highlights as covering the static necessities of encouraging schooling, for example, putting away important moderately enduring data, which doesn't will in general change inside timespans than 24 hours though my comprehension of TeamViewer inferred highlights alludes to their considerably more unique, unconstrained, capricious nature on account of which they have the adaptability expected to rapidly obliging to unforeseeable changes that could result when suddenly choosing to take another albeit more hazardous methodology since it might actually cause to meet the ideal goals a whole lot earlier than at first envisioned.
