

POSITIVE IMPACTS OF COVID-19 PANDEMIC

Subhashree Sahoo, MITS School of Biotechnology

ABSTRACT

The Coronavirus or COVID-19 is a disease based on an unknown virus. It seems that it started in China and has widely spread in almost all countries in the world. This widespread disease situation is one of the widely spread sicknesses in recent history. However, there was an influenza widespread disease in 1918 with the exact number of deaths still unknown. Some believe that the death toll would have been about 50-100 million people. At the time of writing this article, COVID-19 has infected 5,306,928 people worldwide when the article was finalised for book, magazine, etc., the number has increased up to 15,947,291. The article is aimed at analysing the positive and bad effects of COVID-19 in a people-based way of seeing things / sensible view of what is and is not important. It is further focused on possible challenges to the supply chain in South Asia. South Asian countries are highly influenced by the widespread disease situation, and the related to a large area representation is about 4% in the later part of May 2020 with an increasing habit/desire. Also, the article has a proposal for the control of the disease as well as the whole related to how much money and power people have, related to surrounding conditions or the health of the Earth and political atmosphere in a country, while especially giving more weight to South Asia. The proposed actions are analysed in for only a short time, mid-term and long-term basis, and any expert and social worker who is involved in the widespread disease control process can gain an understanding of what to do and how to complete their tasks. A people-based analysis on COVID19 is very important because there is a wing containing/making up most in control/most common medical experts in the control and management of the disease. The article importance and focuses the importance of a people-based analysis in a widespread disease situation. Naturally, anyone would think of a widespread disease situation in very negative terms due to its emotional, related to how much money and power people have, related to surrounding conditions or the health of the Earth, political and cultural factors. However, it is also positive due to certain factors that help to re-combine/re-create and reorganise the social system as a whole.

Keywords: Control and Management, COVID-19, Positive and Negative Impacts, Social Domains, Social Impacts.

INTRODUCTION

There is no argument that the local money-based and social worlds/areas/balls as well as worldwide worlds/areas/balls have been challenged and some parts/areas have been extremely took apart. Therefore, we need to rest our trust mostly on local worlds/areas/balls which help our basic needs and other related to how much money and power people have needs structure. As we know very well, we are in possession of big companies that perform services, like trucking, health care, entertainment, etc., rather than industrial and farming-based parts/areas. In contrast to these areas, we need to maintain sound industrial and farming-based parts/areas to maintain good companies that perform services, like trucking, health care, entertainment, etc. However, our industrial area will be very badly damaged due to COVID-19.

Especially, the clothing and fabric industry will be heavily damaged due to COVID-19, since the widespread disease has very much/very badly affected giant countries such as the USA and related to Europe countries. This will lead to lesser and lesser demand for readymade clothing, this way leading to the closure of many clothing businesses in the country. The factories would not be able to overcome this situation since their buyers would cut down all possible avenues to recover from the terrible and serious situation. Especially, if the people in charge focus on this COVID 19 recovery action plan, it will help protect the family, surrounding conditions and the nation. Therefore, we need to have an attitude-related change towards a more able to last/helping the planet control of the widespread disease situation in our country. The whole analysis of this paper is mainly based on the person who works to find information Sri Skinnyan and other South Asian countries experience, especially in development planning. The understanding of deep things will help to manage and control the COVID-19 widespread disease situation in South Asian countries.
